## What is Clearline?

Clearline is an orthodontic treatment system designed to move and correct, crooked and misaligned teeth. A series of invisible clear aligner trays are worn 22 hours per day to gradually improve your smile and bite. Most of the time its impossible to see that you have aligners in your mouth, and you take them out to eat!

## How does it work?

Your Doctor will design a customized treatment plan for you and send it to the laboratory for manufacturing. Impressions of your mouth are digitized and 3D models of your treatment sequence are created. A series of removable clear plastic aligner trays are custom-made and fit to the molds your teeth. These aligners are worn on your teeth to gradually apply light pressure and slowly straighten your teeth and improve your smile.

## Getting Started

**CONSULTATION-** Talk to your dentist about Clearline and if treatment is right for you. Most patients can benefit from clear aligner orthodontics, but some cases still require “fixed braces” or may not be a candidate at all.

**RECORDS-** Impressions, x-rays, and photographs will be taken of your teeth and act as the foundation of your treatment plan and orthodontic appliances.

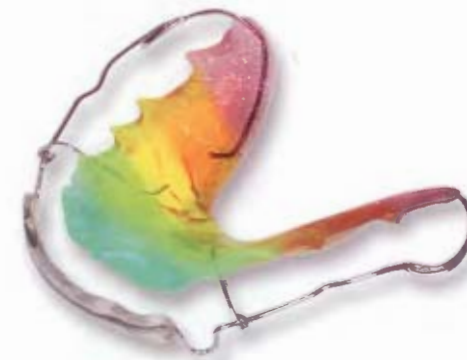

**MANUFACTURING-** Your case will be sent to the laboratory for manufacturing. A series of treatment models is produced with 3D printers and corresponding clear plastic aligner trays are hand-crafted for just for you.

## Aligner Treatment

Your dentist will fit the aligners to your teeth and monitor progress throughout treatment. Alligners are worn 22 hours per day and removed only for eating and brushing. Each stage of treatment consists of a series of up to 6 aligners to be used for a period of 2 weeks each (each tray is numbered in order and marked with a U for upper and a L for lower teeth). There may be as many as 4 stages of treatment (each stage is color-coded). Treatment time can take 6-18 months.

During treatment, it may be required that your dentist reduce the enamel in-between your crowded teeth to make room for straightening. As well, several small tooth-colored attachments may need to be cemented to your teeth temporarily to act as tooth-handles for anchorage to aid in tooth movement.

At the end of active treatment, your dentist will order retainers from the laboratory. Retainers are appliances that are designed to hold and maintain your beautiful smile!

## Benefits and Advantages

Clearline Aligners are comfortable, have little affect on speech, and are nearly invisible. They are easily removed for eating and cleaning, and you can still eat your favorite foods! You can smile as normal, or even remove your aligners for special occasions!

- *Virtually Invisible and transparent*
- *Removable for social situations*
- *Minimal affect on speech*
- *Smooth and comfortable*
- *Brush and floss as normal*
